

FATHAN FAQIH ALI

AI Automation Specialist & Systems Engineer

GitHub: github.com/Shiro291 | Portfolio: github.com/Shiro291/ai-automation-portfolio

PROFESSIONAL SUMMARY

Automation Engineer specializing in programmatic lead routing, conversational AI bots, and high-reliability data pipelines. I build headless automation stacks in Python, design fail-safe webhooks, and orchestrate LLM integrations via the OpenAI API. I treat CRM integrity and API error handling (401s, 422s) as engineering problems, not marketing tasks. If a webhook drops at midnight, I build the catch-route before the client notices.

CORE COMPETENCIES

- **Infrastructure:** Webhooks, REST APIs, JSON Data Mapping, HTTP Auth (OAuth, Bearer)
- **AI/LLM:** OpenAI API, Prompt Engineering, Context Injection, Fallback Handlers
- **Platforms:** Make.com, n8n, GoHighLevel (GHL) Architecture
- **Language/Stack:** Python, FastApi, Asyncio, Headless Automation (Playwright/Scraping)

ENGINEERING & AUTOMATION EXPERIENCE

Internal Tooling & Headless Automation

- Built fully headless, asynchronous Python/Playwright automation scripts (e.g. Jobstreet Auto Apply Bot) to interact with complex web forms, bypassing dynamic DOM structures and executing hundreds of applications deterministically.
- Reduced manual pipeline management by deploying custom scripts to catch, parse, and route notifications, creating a single source of truth for downstream reporting.

Automated Lead Routing & CRM Integrity

- Built custom webhook listeners using FastAPI to ingest cross-platform lead data (Meta forms, landing pages), mapping disparate JSON payloads into unified CRM records with sub-90-second execution times.
- Engineered error-handling routes for API timeouts and 422 Unprocessable Entity drops, ensuring zero silent data loss between landing pages and downstream pipelines.
- Audited and maintained complex multi-step state machines, migrating fragile "happy path" automations into resilient, fault-tolerant flows in n8n and Make.com.

Conversational AI & OpenAI API Integration

- Designed and deployed conversational LLM bots using the OpenAI API, implementing strict context injection and prompt constraints to qualify inbound leads rather than act as generic auto-responders.
- Engineered LLM fallback protocols to detect model hallucination or out-of-bounds user intent, automatically triggering clean human-handoff routing.
- Programmatically extracted unstructured user inputs and normalized them into strict JSON schemas for automated CRM tagging and pipeline stage progression.

EDUCATION

University of Muhammadiyah Prof. Dr. HAMKA | Data & Process Modeling (2021-2025)

SMKN 2 Jakarta | Software Engineering (RPL) Foundation (2019-2021)
